

Campus Energy Survey – Data Analysis

1. Survey Overview

A total of 20 responses were collected through the Campus Energy Saver student survey. The data was analyzed to understand daily electricity-use habits, awareness, barriers, and willingness to adopt energy-saving practices.

2. Key Numerical Findings

Indicator	Result
Total survey responses	20
Laptop/computer use 4+ hours/day	55%
Leave charger plugged in at least sometimes	55%
Leave lights on at least sometimes	65%
Leave fans running at least sometimes	50%
Leave devices in standby at least sometimes	55%
Use power-saving features at least sometimes	80%
Average electricity awareness score	3.1 / 5
Definitely/probably willing to change habits	70%

3. Main Observation

The analysis indicates that unnecessary electricity-use behaviors are present among a considerable proportion of respondents. The highest observed behavior was leaving lights switched on when leaving a room, reported at least sometimes by 65% of respondents. At the same time, 80% reported using power-saving features at least sometimes, showing that many students already practice some energy-saving behavior.

4. Overall Interpretation

The findings suggest that the main opportunity is not only increasing awareness but also helping students convert awareness into consistent daily habits. Since 70% of respondents showed willingness to change their electricity-use habits, simple reminders, checklists, and awareness activities could be practical approaches for encouraging behavioral improvement.
